ORAL CANCER

Cancer is referred to as an abnormal and uncontrolled cellular growth. Oral cancer is a broad term that refers to any cancer in the mouth and throat region. It belongs to a larger group of cancers called head and neck cancers.

Frequently Asked Questions

1. Where in the mouth or throat might oral cancer occur?

Oral cancer can occur in both the soft and hard tissues of the mouth and throat.

- Examples of soft tissue are the lips, tonque, floor of the mouth, salivary glands and the lymphatic tissue.
- Examples of hard tissue are the bones of the upper and lower jaws as well as the roof of the mouth.

2. What are some of the common risk factors associated with oral cancer?

- The use of tobacco products: Either by smoking, chewing or vaping.
- Excessive alcohol consumption.
- Excessive exposure to the sun.
- Previous Human Papillomavirus [HPV] infection.
- Increasing age especially 40-60 years old.
- Poor nutrition.

3. What are some of the signs and symptoms of oral cancer?

- A soreness or feeling that something is in the back of the throat.
- Difficulty in swallowing, chewing or moving the lower jaw or tongue.
- Unexplained numbness or tingling in the lips, face or tongue.
- A change in the voice, or a continuing hoarseness or cough.
- A persistent rough spot, lump or bump anywhere in or around the mouth or neck.
- An ulcer, or red white or black patch that does not go away.
- A hard unexplained swelling on the outside of your neck.

4. How can the risk of oral cancer be reduced?

- Avoid the use of tobacco products.
- Reduce excessive alcohol consumption.
- Limit exposure to the sun and use a sunblock on the lips.
- Be vaccinated against HPV.
- Eat a healthy nutritious diet.

5. In what ways may oral cancer be detected?

- Physical Examination: Oral cancer is often found by dentists and physicians during routine check-ups and physical examinations, by looking for changes in the tissues around the mouth or neck.
- Endoscopy using a small camera inserted through the nose or mouth to view areas of the mouth and throat.
- Imaging of suspicions areas by the use of X-rays, Computed Tomography [CT], Magnetic Resonance Imaging [MRI] or Positron Emission Tomography [PET] scans.
- Biopsy, involving removing a small piece of tissue for microscopic examination.
- Ultrasound to look for nodules in the neck.

6. What are some of the treatments for oral cancer?

- Oral cancer stages are indicated using Roman numerals 1 through IV. A lower stage such as stage 1 indicates a smaller cancer confined to one area. A higher stage such as stage IV indicates a larger cancer or one that has spread. The stage of the cancer will help determine the treatment choice.
- Besides the stage, treatment will depend on the cancer's location as well as a person's overall health and personal choice.
